ABSTRACT

\[
\text{(1) } R_1CO_2H, \text{ DCC, HOBr, DMAP, Et}_3\text{N, CH}_2\text{Cl}_2; \text{ (ii) Et}_3\text{OBF}_4/\text{THF}; \\
\text{ (iii) Sodium cyclopentadienide/THF; (iv) Benzoquinones or indoanilines}
\]

A traceless solid-phase synthesis of cyclopenta[c]-4H-chromen-8-ol, benzo[d]cyclopenta[e]-3H-3-azin-8-ol, and other 11-heterosteroids via the fulvene hetero [6 + 3] cycloaddition is described.

The explosive development of combinatorial chemistry over the past few years has led to a renaissance in the development of solid-phase synthetic methodologies.1,2 The development of efficient and reliable methods of forming carbon–carbon bonds remains an important issue in solid-phase synthesis. In conjunction with our continuing efforts in fulvene chemistry,3 we recently reported the fulvene hetero [6 + 3] cycloaddition4 and the facile synthesis of 11-oxosteroid derivatives.3 The synthesis and physiological activity of heterosteroids have received a lot of attention over the years.6 In light of the physiological significance of the 11-oxo-adrenocortical hormones, heterosteroids in which the methylene group at position 11 has replaced by a heteroatom are of special interest.7 Herein, we report the application of this technology to the solid-phase synthesis of cyclopenta[c]-4H-chromen-8-ol, benzo[d]cyclopenta[e]-3H-3-azin-8-ol and 11-heterosteroids libraries. To the best of our knowledge, this is the first example of a [6 + 3] cycloaddition as well as the first example of fulvene chemistry on solid support.

Scheme 1 outlines our traceless linker strategy using polystyrene amino resin (1).8 Formic acid was coupled to 1.

(2) For an excellent example of a recent publication, see: Nicolaou, K. C.; Snyder, S. A.; Bigot, A.; Pfefferkorn, J. A. Angew. Chem., Int. Ed. 2000, 59, 1093.

(8) Purchased from Aldrich Chemical Co. (1.5 mmol/g) or Advanced ChemTech, Inc. (1.1 mmol/g, 100–200 mesh).
under standard conditions (DCC, HOBT, DMAP, CH₂Cl₂). Product 2a was then treated with Et₃OBF₄ in THF at 0 °C for 1 h. Subsequently, a 3.0 M THF solution of sodium cyclopentadienide was added and the reaction was slowly warmed to room temperature and agitated for 12 h. The resin was filtered, washed with CH₂Cl₂ (3 ×), and dried under high vacuum to afford 3a. The fulvene resin 3a (100 mg) was added to a solution of benzoquinone in C₆H₆ (0.8 mL, 0.1 M), and the mixture was placed on a rotary motor for 12 h at 25 °C. The supernatant was filtered through a short pad of silica gel and eluted with 4 mL of C₆H₆. Product 4a was isolated in greater than 95% purity, with no other observable side products. The same reaction sequence was successfully carried out on a 10-fold larger scale without any loss of purity. The methodology was then generalized to a 110-membered heterosteroid library. A selection of 5 carboxylic acids, 2 cyclopentadienyl anions, and 11 benzoquinones were reacted according to the process illustrated in Scheme 1. Following SiO₂ filtration, the final products were isolated in good yield and >95% purity as determined by HPLC and/or GC-MS analysis (Table 1).

**Table 1. Traceless Solid-Phase Synthesis of 4 via Hetero [6 + 3] Cycladdition**

Preliminary in vitro assay revealed that 4Be and 4Bj possess moderate inhibitory activity against a variety of NCI cancer cell lines (average GI₅₀ = 2.4 × 10⁻⁵ and 9.5 × 10⁻⁶ M, respectively). It is noteworthy that 4Bj exhibits high inhibitory activity against MCF7 and T-47D breast cancer cells (GI₅₀ = 3.9 × 10⁻⁷ and 3.0 × 10⁻⁷ M, respectively). We are currently following up on these results.

(9) The reactions were conducted in Bio-Rad Econo-Pac Disposable columns. Agitation was accomplished by rotating the column with a rotary motor unless otherwise indicated. The extent of the coupling reaction was monitored by IR.

(11) The reaction was agitated in an ultrasonic bath.

(12) In solution phase, this reaction was completed in a few minutes.

(13) The purity of the products was determined by GC-MS and HPLC analysis.

(14) The product was isolated by its ¹H and ¹³C NMR spectrum.

(15) The loading of the fulvene resin 3 was estimated to be 0.4 mmol/g on the basis of the consumption amount of benzoquinones in the following hetero [6 + 3] reaction (assume 100% conversion in the reaction). On the basis of this loading number, we noticed that when slightly less than 1 equiv of benzoquinone was used in the last step, products 4 were isolated free of impurity as shown by HPLC. The following are selected overall yields of isolated products after four steps: 4Be (40%), 4Bj (42%), 4Bi (38%), 4Bk (32%). These yields are based on the initial loading of the amino polystyrene resin (1.1 mmol/g).

(16) Selected spectral data for 4Be: ¹H NMR (acetonitrile-d₃, 400 MHz) δ 7.64 (dd, J = 2.8, 1.2 Hz, 1H), 7.20 (s, 1 H), 7.07 (d, J = 2.8 Hz, 1 H), 7.02 (d, J = 1.2 Hz, 1 H), 2.79 (s, 3 H); ¹³C NMR (acetonitrile-d₃, 100 MHz) δ 158.56 (C), 151.97 (C), 140.02 (C), 133.03 (CH), 123.67 (C), 122.69 (C), 122.57 (C), 122.18 (C), 120.35 (CH), 115.39 (CH), 115.39 (CH), 18.57 (CH); MS (m/z, relative intensity) 270 (M⁺ + 4, 13), 268 (M⁺ + 2, 64), 266 (M, 100), 231 (8), 167 (10), 139 (33); exact mass calculated for C₂₁H₁₄Cl₂ (M⁺) 265.9902, found 265.9903. For 4Bi: ¹H NMR (DMSO-d₆, 400 MHz) δ 8.29 (d, J = 8.8 Hz, 1 H), 7.47 (d, J = 2.4 Hz, 1 H), 7.22 (dd, J = 2.8, 9.2 Hz, 1 H), 7.20 (s, 1 H), 7.00 (d, J = 2.8 Hz, 1 H), 6.86 (dd, J = 4.8, 1.2 Hz, 1 H), 6.71 (dd, J = 2.4, 1.2 Hz, 1 H); ¹³C NMR (DMSO-d₆, 100 MHz) δ 156.57 (C), 155.52 (C), 149.56 (C), 137.44 (C), 131.12 (CH), 126.04 (C), 124.65 (C), 122.56 (CH), 121.53 (C), 119.23 (C), 118.98 (CH), 114.14 (CH), 111.37 (CH), 108.12 (CH), 105.29 (CH), 100.73 (CH), 17.94 (CH); MS (m/z, relative intensity) 264 (M⁺ + 100), 235 (12), 221 (8), 189 (9), 178 (10), 125 (15), 111 (22); exact mass calculated for C₁₃H₁₄O₂Cl (M⁺) 264.0786, found 264.0781.

(17) The testing was performed by the Developmental Therapeutics Program, NCI, USA. The compounds were evaluated for their in vitro cytotoxicity against 60 human cell lines derived from seven clinically isolated cancer types (lung, colon, melanoma, renal, ovarian, brain, and leukemia) according to the NCI standard protocol, see: http://dtp.nci.nih.gov/.

In conclusion, we have developed a novel example of the construction of steroid frameworks on solid supports. The mildness of the reaction and traceless cleavage conditions make this process well suited to automated synthesis for the construction of large array libraries. This strategy exploits a unique reaction for liberating the fully elaborated product from resin and offer a new approach toward combinatorial libraries of hereocsteroids frameworks. An extension of this sequence to a more extensive library synthesis and the biological screening assay is currently underway.

Acknowledgment. We are grateful to Dr. Sepehr Sarshar for his initial suggestions and valuable discussions. Thanks are also due to the staff of the National Cancer Institute, USA, for the anticancer test. Mass spectra were provided by the National Science Council Spectroscopic Service Center. Financial support from the National Science Council (NSC 89-2113-M-194-003) and National Chung Cheng University is gratefully acknowledged.
